What do we offer

At Earthcure Global Ltd, we are dedicated to offering practical solutions for managing natural waste challenges other companies face. See our services below.

Dirt remediation

Using the Earthcure technique, we can work closely with your contamination experts to treat contaminated soil onsite. Aeration, the fast and accurate blending of additives or neutralization agents to stabilize the contaminated soil through the Earth Warrior, is a proven solution and is now setting the standard for onsite soil remediation.

Waste reduction

We minimise offsite waste disposal, leading to reduced waste classification and lower disposal costs. Our expertise extends to handling large-scale illegal tip site cleanups and addressing mixed waste stockpiles.

We adopt a collaborative approach in these projects, working closely with remediation consultants, soil scientists, geotechnical experts, and civil contractors to ensure optimal project outcomes.

Soil Amelioration

Turning your unsuitable earth into specification topsoil. Earthcure is able to turn your 'unsuitable' materials into specification topsoils for reuse on your project. Doing this means you are reusing your site's materials, reducing the cost of disposing of waste and reducing the number of trucks on local roads around your project.

Earth Unification

We are specialising in unification, streamlining the process by utilising existing site materials instead of importing fill, resulting in a more cost-effective and timely completion of projects. This innovative technology is a cost-effective, environmentally friendly solution for geotechnical experts, soil consultants, civil contractors, and those helping to restore the planet.

Other Services

We have partnerships with a number of other complimentary businesses and can provide you with introductions or work alongside these contractors to deliver the best outcomes for your projects:

Soil Testing

Excavation and spreading services

Revegetation Services
